## muCommander - Quantum Edition v1.1

For the Scalar LTFs 2.3 release, Quantum is including a modified version of muCommander as the recommended file browser for Windows and MacOS. Some native file browsers and applications will attempt to perform hidden file reads to gather file information for user presentation causing unexpected tape mounts and severe performance issues. Quantum's version of muCommander eliminates these issues.

## General Issues

The following are important items not covered in the Known Issues section of this document.

- With NFS, if all resources are busy, system calls may receive an EAGAIN failure. This requires the operation to be retried by the host application.
- SLTFS does not support RealTek Ethernet cards on MacOS.
- Files copied from a Windows system to SLTFS and opened on MacOS sometimes produce an -8084 error. To avoid this error, copy to SLTFS media rather than a direct copy from Win7 to MacOS.
- On MacOS, copying files to newly formatted media can cause a dialog to display stating that a newer version already exists in the location you are trying to copy to. When the Finder displays the replace dialog, click **Yes**.
- With NFS, if the Scalar LTFS appliance is restarted, users will have to unmount and remount the NFS share.
- If newly attached media are not displaying in the NFS share, unmount and remount the NFS share.
- Due to tape latency it is possible that file I/O may timeout which will require the user to retry the I/O from the host system. For more details on advanced configuration, reference Chapter 2 - Best Practices in the Scalar LTFS User's Guide.
- Some special characters used by Mac are not supported by the LTFS format.

## Resolved Issues

This release of Scalar LTFS has the following resolved issues:

Change Request Number	Service Request Number	Description	Solution
52359		Copying files to and from the SLTFS appliance may cause the system to fail.	Fixed.
50339		Due to size constraints, all indexes may not be contained in the save/restore image.	Fixed.

## Known Issues

This release of Scalar LTFS has the following known issues:

Change Request Number	Service Request Number	Description	Workaround
		When logging into SLTFS, users may see an 'unsafe connection' warning relating to Internet certificates.	Click the button on your related Internet browser to accept and continue.
51679		Performing a media copy of a tape with an alias and attempting to attach both media will generate a diagnostic ticket. This is expected behavior.  However, in the GUI it may show that the aliases are different. This is because the database that stores the alias value was not updated properly.	To avoid getting the diagnostic ticket, you must enter a new alias for the tape you copied the data to.  <ol style="list-style-type: none"> <li>1 From the SLTFS GUI, sequester the original source media.</li> <li>2 Attach the destination media.</li> <li>3 From your file system, change the alias on the destination media.</li> <li>4 From the GUI, reattach the source media.</li> </ol>
51373		Performing a media copy from the SLTFS GUI shows both the source and destination media.	No attempt to read or write to these media through the file system should be made while the media copy is in progress.
