muCommander - Quantum Edition

For the Scalar LTFS 2.3 release, Quantum is including a modified version of muCommander as the recommended file browser for Windows and MacOS. Some native file browsers and applications will attempt to perform hidden file reads to gather file information for user presentation causing unexpected tape mounts and severe performance issues. Quantum's version of muCommander eliminates these issues.

General Issues

The following are important items not covered in the Known Issues section of this document.

- With NFS, if all resources are busy, system calls may receive an EAGAIN failure. This requires the operation to be retried by the host application.
- SLTFS does not support RealTek Ethernet cards on MacOS.
- Files copied from a Windows system to SLTFS and opened on MacOS sometimes produce an -8084 error. To avoid this error, copy to SLTFS media rather than a direct copy from Win7 to MacOS.
- On MacOS, copying files to newly formatted media can cause a dialog to display stating that a newer version already exists in the location you are trying to copy to. When the Finder displays the replace dialog, click Yes.
- With NFS, if the Scalar LTFS appliance is restarted, users will have to unmount and remount the NFS share.
- If newly attached media are not displaying in the NFS share, unmount and remount the NFS share.
- Due to tape latency it is possible that file I/O may timeout which will require
 the user to retry the I/O from the host system. For more details on advanced
 configuration, reference Chapter 2 Best Practices in the Scalar LTFS User's
 Guide.
- Some special characters used by Mac are not supported by the LTFS format.

General Issues 5

Resolved Issues

This release of Scalar LTFS has the following resolved issues:

Change Request Number	Service Request Number	Description	Solution
53356		Bash security issue.	Fixed.
52985		NFS is slow to display on startup.	Fixed. SLTFS uses information from the database to speed up NFS start up.
53066		Using Windows Explorer to view media with large indexes will timeout before completion.	Fixed. SLTFS uses information from the database to display media information from large indexes in Windows Explorer.
52983		The file system on the SLTFS appliance is using all available memory.	Fixed. Memory used for SLTFS has been limited.

Known Issues

This release of Scalar LTFS has the following known issues:

Change Request Number	Service Request Number	Description	Workaround
42470		When logging into SLTFS, users may see an 'unsafe connection' warning relating to Internet certificates.	Click the button on your related Internet browser to accept and continue.
51679		Performing a media copy of a tape with an alias and attempting to attach both media will generate a diagnostic ticket. This is expected behavior. However, in the GUI it may show that the aliases are different. This is because the database that stores the alias value was not updated properly.	 To avoid getting the diagnostic ticket, you must enter a new alias for the tape you copied the data to. 1 From the SLTFS GUI, sequester the original source media. 2 Attach the destination media. 3 From your file system, change the alias on the destination media. 4 From the GUI, reattach the source media.

6 Resolved Issues

Change Request Number	Service Request Number	Description	Workaround
51373		Performing a media copy from the SLTFS GUI shows both the source and destination media.	No attempt to read or write to these media through the file system should be made while the media copy is in progress.
