## General Cabinet Information

This section includes the following information:

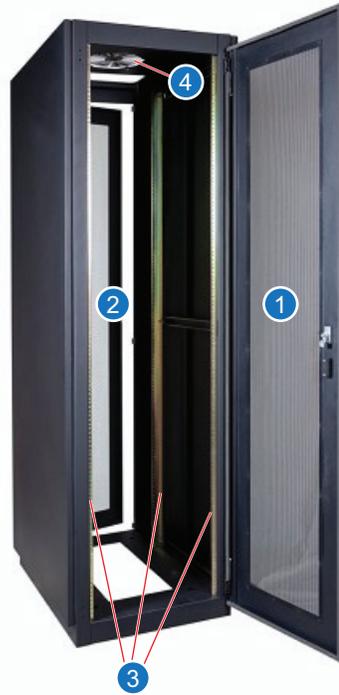

- [Standard Cabinet](#)
- [Cabinet Height](#)
- [Cabinet Vertical Support Rails](#)
- [Cabinet Configurations with Chassis and Drives](#)

### Standard Cabinet

Figure 3 provides an image of a standard cabinet which includes locations of the following:

- Front door
- Rear door
- Vertical support rails
- Air vent

Figure 3 Standard Cabinet

- |                          |             |
|--------------------------|-------------|
| 1 Front door             | 2 Rear door |
| 3 Vertical support rails | 4 Air vent  |

Standard features of the cabinet include:

- Front and rear door that can be closed and locked
- Vertical rails, with mounting holes, to allow installation of storage
- 40U high cabinet and 19 inches/48.3cm wide
- Four rolling coasters/wheels
- Four leveling pads (bottom of cabinet)
- A stabilizing foot (after installation of permanent location)
- Access for storage cabling
- AC or DC power source (2 each)

**WARNING!** Risk of bodily harm and/or injury. Comply with the following:

- Always populate the cabinet from bottom to top to prevent tipping.
- If a cabinet must be moved, use adequate personnel and/or a forklift to relocate the cabinet.
  - Push the cabinet from the front when moving.
  - A fully populated cabinet can weigh almost 3000 pounds (1360.777kg).
  - Cabinets are hard to move, even on a flat surface/floor.
- If moving a cabinet on an incline, always remove the top-half storage arrays/devices to prevent from tipping.

---

**NOTE:** Install the applicable storage rack on the cabinet support rails, then install the chassis/expansion storage unit, and then populate the unit with applicable drives (HDDs or SSDs).

---

Ensure to place the cabinet in a location that allows sufficient space to maintain and service (remove and replace parts) the applicable units within the cabinet.

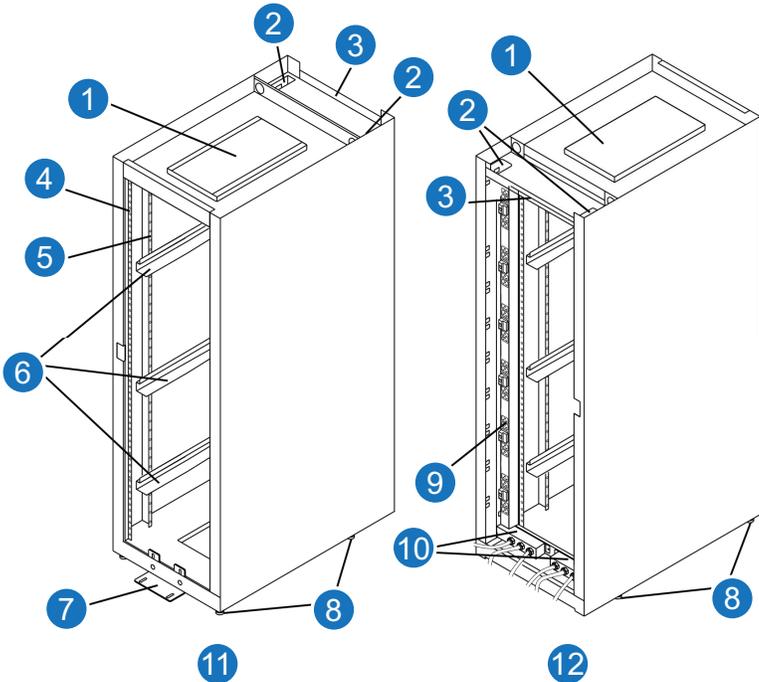

## Cabinet Height

Cabinets heights might vary. A common cabinet is 40U high.

- A height of 1U equals 1.75-inches (44.45-mm).
- So, a 40U cabinet will have 70 inches (1778 mm/1.778 km) of storage space.

Figure 4 provides a standard cabinet identifying components (callouts) in the front and rear of the unit. Callout descriptions are provided below the illustration.

## Cabinet Vertical Support Rails

The cabinet vertical support rails can contain square holes, round holes, or pre-tapped holes. Refer to the following documents for rackmount installation information:

- *QX and QXS 12- and 24-Drive Rackmount Install Guide* (Doc number: 6-68390-01)
- *QXS 48-Drive Rackmount Install Guide* (Doc number: 6-68391-01)
- *QXS 56-Drive Rackmount Install Guide* (Doc number: 6-68392-01)

## Cabinet Configurations with Chassis and Drives

Table 3 provides the maximum number of chassis and maximum number of drives that can be installed within a standard 40U cabinet configuration.

**NOTE:** Configurations depend on customer requirements. Refer to [QXS-3/4/6 Series Supported Configurations](#) on page 5 for RAID chassis and expansion chassis maximum combinations.

Note 1: Always consider the max drive number when mixing different chassis combinations.

Note 2: It is impossible to identify all possible chassis combinations within the hybrid QXS supported configurations.

---

**CAUTION:** Ensure that the cabinet weight (populated with chassis, drives, units) does not exceed the floor loading specifications.

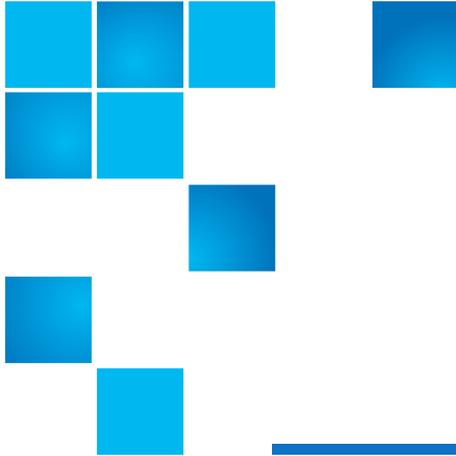

---

You should record the total weight of your applicable cabinets (with contents). Use this information to check floor loading restrictions and/or elevator weight restrictions.

## Bezel

The QXS 2U drive chassis includes a bezel sub-assembly that attaches to the front panel of the chassis. The bezel, comprised of a vented cover attached to an electro-magnetic interference (EMI) shield, is pre-assembled and packed within a box contained in the enclosure master shipping container.

Instructions for attaching/removing the bezel are provided in the *QXS Bezel Installation Guide*.

---

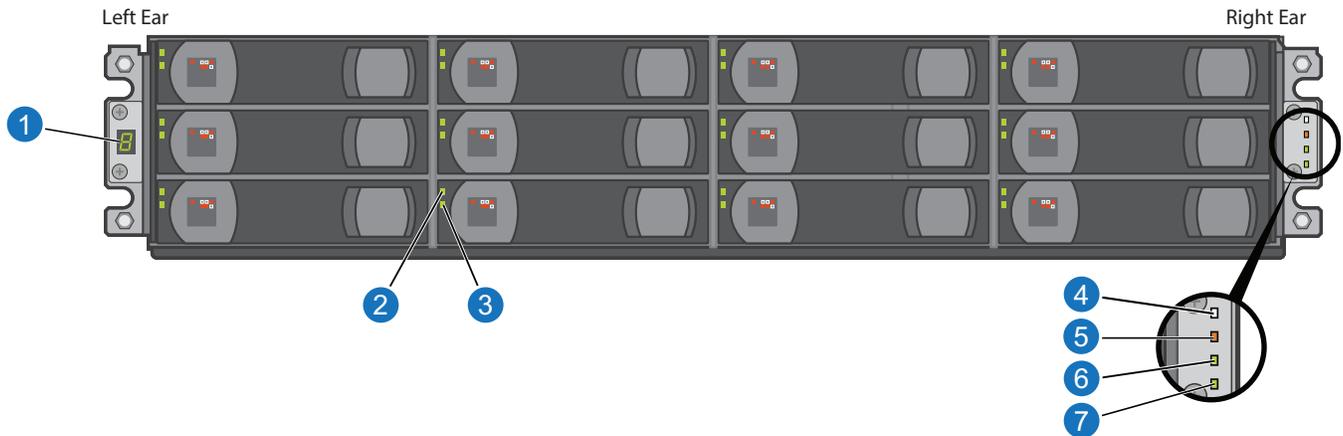

**CAUTION:** The bezel should be properly installed while the chassis is in operation to ensure adequate EMI protection for the drives.

# QXS-312/324 RAID and Expansion Physical Requirements

The floor space at the installation site must be strong enough to support the combined weight of the rack, RAID chassis, expansion chassis, and any additional equipment. The site also requires sufficient space for installation, operation, and servicing of the chassis, together with sufficient ventilation to allow a free flow of air to all chassis.

## Composition

The RAID chassis and expansion chassis is comprised of sheet steel that is bonded together using rivets, welding, and other forced contact methods. The metal surfaces are free from non-conductive coatings and paint.

## Chassis Designators

The RAID and expansion chassis designators are as follows:

- 2U12 chassis (LFF):
  - “2U12” denotes the 3.5” QXS-312 chassis (with controller or expansion modules)
  - The 2U12 chassis is equipped with a drive in each drive slot
- 2U24 chassis (SFF):
  - “2U24” denotes the 2.5” QXS-324 chassis (with controller or expansion modules)
  - The 2U24 chassis is equipped with a drive in each drive slot
- Two controller modules or two expansion modules per chassis
- Two power supplies per chassis

## Bezel

The QXS 2U drive chassis includes a bezel sub-assembly that attaches to the front panel of the chassis. The bezel, comprised of a vented cover attached to an electro-magnetic interference (EMI) shield, is pre-assembled and packed within a box contained in the enclosure master shipping container.

Instructions for attaching/removing the bezel are provided in the *QXS Bezel Installation Guide*.

---

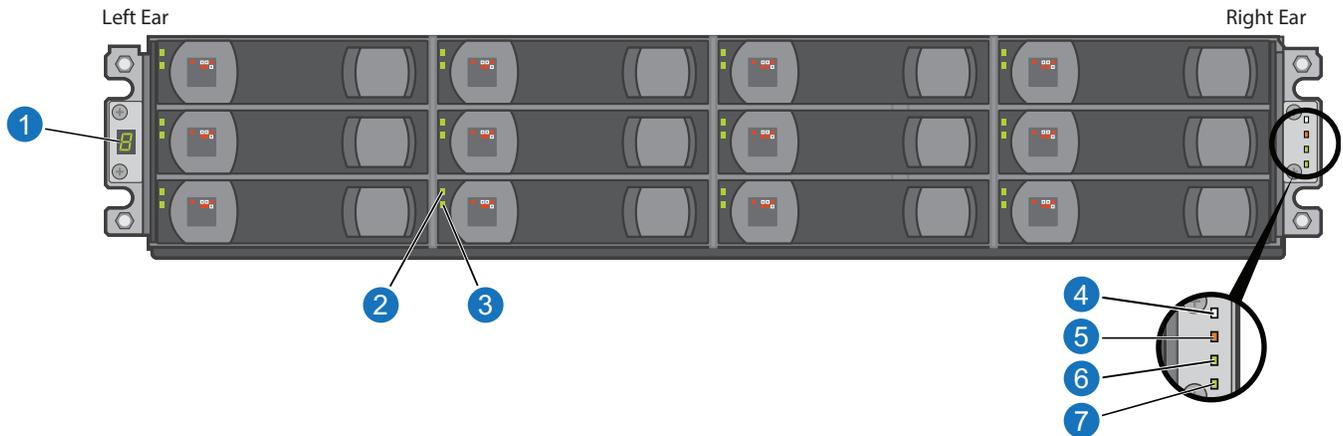

**CAUTION:** The bezel should be properly installed while the chassis is in operation to ensure adequate EMI protection for the drives.

# QXS-4 Series RAID and Expansion Physical Requirements

The QXS-4 series RAID and Expansion chassis consist of the following systems:

- QXS-412 (12-drive, LFF drives)
- QXS-424 (24-drive, SFF drives)
- QXS-448 (48-drive, SFF drives)
- QXS-456 (56-drive, LFF drives)

The floor space at the installation site must be strong enough to support the combined weight of the rack, RAID chassis, expansion chassis, and any additional equipment. The site also requires sufficient space for installation, operation, and servicing of the chassis, together with sufficient ventilation to allow a free flow of air to all chassis.

## Composition

The RAID chassis and expansion chassis is comprised of sheet steel that is bonded together using rivets, welding, and other forced contact methods. The metal surfaces are free from non-conductive coatings and paint.

## Chassis Designators

The RAID and expansion chassis designators are as follows:

- 2U12 chassis (LFF):
  - “2U12” denotes the 3.5” 12-drive chassis (with controller or expansion modules)
  - The 2U12 chassis is equipped with a drive in each drive slot
- 2U24 chassis (SFF):
  - “2U24” denotes the 2.5” 24-drive chassis (with controller or expansion modules)
  - The 2U24 chassis is equipped with a drive in each drive slot
- 2U48 chassis (SFF):
  - “2U48” denotes the 2.5” 48-drive chassis (with controller or expansion modules)
  - The 2U48 chassis includes three installed drawers that must be populated with drives and possibly air management system (AMS) inserts if applicable, after the chassis is installed into the rack.
  - The table in this section assumes each drive slot contains a drive module.
- 4U56 chassis (high-capacity with LFF drives)
  - “4U56” denotes the 3.5” 56-drive chassis (with controller or expansion modules)
  - The 4U56 chassis includes two installed drawer slots that must be populated with drives after the chassis is installed into the rack.
- Two controller modules or two expansion modules per chassis
- Two power supplies per chassis

# QXS-6 Series RAID and Expansion Physical Requirements

The QXS-6 series RAID and Expansion chassis consist of the following systems:

- QXS-448 (48-drive, SFF drives)
- QXS-456 (56-drive, LFF drives)

The floor space at the installation site must be strong enough to support the combined weight of the rack, RAID chassis, expansion chassis, and any additional equipment. The site also requires sufficient space for installation, operation, and servicing of the chassis, together with sufficient ventilation to allow a free flow of air to all chassis.

## Composition

The RAID chassis and expansion chassis is comprised of sheet steel that is bonded together using rivets, welding, and other forced contact methods. The metal surfaces are free from non-conductive coatings and paint.

## Chassis Designators

The RAID and expansion chassis designators are as follows:

- 2U48 chassis (SFF):
  - “2U48” denotes the 2.5” 48-drive chassis (with controller or expansion modules)
  - The 2U48 chassis includes three installed drawers that must be populated with drives and possibly air management system (AMS) inserts if applicable, after the chassis is installed into the rack.
  - The table in this section assumes each drive slot contains a drive module.
- 4U56 chassis (high-capacity with LFF drives)
  - “4U56” denotes the 3.5” 56-drive chassis (with controller or expansion modules)
  - The 4U56 chassis includes two installed drawer slots that must be populated with drives after the chassis is installed into the rack.
- Two controller modules or two expansion modules per chassis
- Two power supplies per chassis

## Site Requirements

The following sections provide requirements and guidelines that you must address when preparing your site for the installation.

When selecting an installation site for the system, choose a location not subject to excessive heat, direct sunlight, dust, or chemical exposure. These conditions greatly reduce the system's longevity and might void your warranty.

### Chassis Power Requirements

Each chassis has two power supplies for redundancy. If full redundancy is required, use a separate power source for each module.

The AC power in each power supply is auto-ranging and is automatically configured to an input voltage range from 88 – 264 VAC with an input frequency of 47 – 63 Hz. The power supplies meet standard voltage requirements for both U.S. and international operation. The power supplies use standard industrial wiring with line-to-neutral or line-to-line power connections.

The 2U24/2U12 chassis and the high-density 4U56 chassis support DC power supplies as an alternative to using AC power supplies.

Each power cable connects one of the power supply modules to an independent, external power source. To ensure power redundancy, connect the two power cables to two separate circuits; for example, to one commercial circuit and one uninterruptible power source (UPS).

## RAID and Expansion Chassis Site Wiring and AC Power Requirements

Table 26 provides the RAID chassis AC power requirements required for all installations using AC power supplies in the QXS 12, 24, 48, and 56-drive systems.

Additional requirements include:

- All AC mains and supply conductors to power distribution boxes for the rack-mounted system must be enclosed in a metal conduit or raceway when specified by local, national, or other applicable government codes and regulations.
- Ensure that the voltage and frequency of your power source match the voltage and frequency inscribed on the equipment's electrical rating label.

- To ensure redundancy, provide two separate power sources for the chassis . These power sources must be independent of each other, and each must be controlled by a separate circuit breaker at the power distribution point.
- The system requires voltages within minimum fluctuation. The customer-supplied facilities' voltage must maintain a voltage with not more than  $\pm 5$  percent fluctuation. The customer facilities must also provide suitable surge protection.
- Site wiring must include an earth ground connection to the AC power source. The supply conductors and power distribution boxes (or equivalent metal chassis) must be grounded at both ends.
- Power circuits and associated circuit breakers must provide sufficient power and overload protection. To prevent possible damage to the AC power distribution boxes and other components in the rack, use an external, independent power source that is isolated from large switching loads (such as air conditioning motors, elevator motors, and factory loads).

## Weight and Placement Guidelines

Weight and placement guidelines include:

- Refer to the rackmount bracket kit installation guide pertaining to your product for guidelines about installing chassis into the rack.
- When installing chassis into the rack, populate from the bottom position and move upwards for optimal rack stability.
- The weight of an chassis depends on the number and type of modules installed.
- Ideally, use two people to lift a chassis. However, one person can safely lift an chassis if its weight is reduced by removing the power supplies and drive modules.
- Do not place chassis in a vertical position. Always install and operate the chassis in a horizontal orientation.
- When installing chassis in a rack, make sure that any surfaces over which you might move the rack can support the weight. To prevent accidents when moving equipment, especially on sloped loading docks and up ramps to raised floors, ensure you have a sufficient number of helpers. Remove obstacles such as cables and other objects from the floor.
- To prevent the rack from tipping, and to minimize personnel injury in the event of a seismic occurrence, securely anchor the rack to a wall or other rigid structure that is attached to both the floor and to the ceiling of the room.

## Electrical Guidelines

Electrical guidelines include:

- These chassis work with single-phase power systems having an earth ground connection. To reduce the risk of electric shock, do not plug an chassis into any other type of power system.

---

**NOTE:** Contact your facilities manager or a qualified electrician if you are not sure what type of power is supplied to your building.

---

- Chassis are shipped with a grounding-type (three-wire) power cord. To reduce the risk of electric shock, always plug the cord into a grounded power outlet.
- Do not use household extension cords with the chassis. Not all power cords have the same current ratings. Household extension cords do not have overload protection and are not meant for use with computer systems.

# Ventilation and Cabling Requirements

This section includes the following information:

- [Ventilation Requirements](#)
- [Cabling Requirements](#)

## Ventilation Requirements

Ventilation requirements include:

- Do not block or cover ventilation openings at the front and rear of an chassis. Never place an chassis near a radiator or heating vent. Failure to follow these guidelines can cause overheating and affect the reliability and warranty of your chassis.
- Leave a minimum of 15.2 cm (6 inches) at the front and rear of each chassis to ensure adequate airflow for cooling. No cooling clearance is required on the sides, top, or bottom of chassis .
- Leave enough space in the front and rear of an chassis to allow access to chassis components for servicing. Removing a component requires a clearance of at least 38.1 cm (15 inches) in front of and behind the chassis.

## Cabling Requirements

Cabling requirements include:

- Keep power and interface cables clear of foot traffic. Route cables in locations that protect the cables from damage.
- Route interface cables away from motors and other sources of magnetic or radio frequency interference.
- Stay within the cable length limitations.
- QXS Storage RAID chassis and expansion chassis are suitable for connection to intra-building or non-exposed wiring or cabling only.
- QXS Storage RAID chassis and expansion chassis are suitable for installation in Network Telecommunication Facilities and locations where the NEC applies. QXS Storage RAID chassis and expansion chassis are not suitable for Outside Plant (OSP) installations.

# Management Host Requirements

A local management host with at least one mini-USB connection is recommended for the initial installation and configuration of a RAID chassis. After you configure one or both of the controller modules with an IP address, you then use a remote management host on an Ethernet network to manage and monitor.

---

**NOTE:** Connections to this device must be made with shielded cables – grounded at both ends – with metallic RFI/EMI connector hoods, in order to maintain compliance with NEBS and FCC Rules and Regulations.
